

Linh Tran

About me

- I'm a generalist and adaptive engineer with a strong foundation in software engineering, now focused on building the future of software with AI.
- I believe AI will not just assist, but reshape software engineering. This transformation opens a new frontier — and I'm working to push its boundary.
- Current focus:
 - Research: Advancing open-source AI models for autonomous software engineering tasks
 - Engineering: Building developer tools powered by cutting-edge models (e.g. Sonnet 3.7) to boost productivity and creativity
- I thrive on solving hard problems, connecting ideas across domains, and turning vision into working systems.

Experience

Jan 2024 - Jan 2025 **Lead engineer** - Rikkeisoft, Vietnam
Out-sourced projects

UJET

- Led a 5-person team to deliver core features for a contact center-as-a-service platform.
- Streamlined delivery pipelines and improved development velocity in a high-stakes, enterprise-grade environment.
- Acted as a technical liaison between offshore and client-side teams, ensuring code quality, architectural alignment, and on-time delivery.

Jan - Dec 2023 **Lead engineer** - Sotatek, Vietnam
Out-sourced projects

The Cardano Foundation project

- Architected and implemented a high-performance vector search engine for matching 3D bullet toolmarks.
- Replaced legacy R-based search (minutes) with a Java+HNSW solution (seconds), drastically reducing response time.
- Derived and adapted open-source algorithms (e.g. CMC, CMS) to convert 3D toolmarks into vector embeddings, making search both fast and accurate.
- Bridged research and production by turning academic ideas into scalable, real-world systems.

Devexa project

- Integrated NLP components into backend workflows to enhance chatbot accuracy and responsiveness.

- Collaborated directly with the client's product team in an agile, multi-timezone setup.

Jan - Dec 2022 **Senior software engineer** - Garena (Sea group)
Largest mobile game company in Southeast Asia.

- Built high-throughput backend services for event microsites serving tens of millions of gamers (e.g., League of Legends, Arena of Valor).
- Delivered robust infrastructure capable of handling large traffic spikes with minimal latency.
- Worked cross-functionally with frontend, ops, and marketing teams to ensure real-time responsiveness during large-scale esports events.

Jan - Oct 2021 **Self-employed** - XSeed cloud gaming

- Built a full-stack cloud gaming prototype using KVM + NVIDIA vGPU and customized Moonlight client.
- Designed for low-latency remote gameplay experience, solving GPU resource allocation and compression bottlenecks.
- Demonstrated initiative in exploring frontier tech stacks for a highly technical challenge.

Jan 2018 - Dec 2020 **Software engineer** - Pique AI (now part of **MoMo** - largest mobile wallet in Vietnam)

- Early-stage contributor to a startup that built multimodal AI recommendation engines.
- Took on hybrid roles in software engineering and data science; shipped production-grade systems with limited resources.
- Highlight: Optimized k-NN recommendation API (based on Spotify's open-source engine) and doubled system performance.
- Key projects:
 - Music recommendation for NCT (Vietnam's 2nd largest digital music provider)
 - Visual-based dating app matching (Japan market)
 - Jewelry recommendation using hybrid text + image embeddings (Glamira)

Education

2012-2019 **Computer Science** - Hanoi University of Science and Technology, Vietnam
Thesis: Learned video compression for game streaming application

2015-2016 **Erasmus Scholarship Exchange** - Uppsala University, Sweden
